Solving “SQL Skillz” (50 pts - Mobile App / SQL)

A mobile-app artifact walkthrough that uses a recovered patient ID to query a bundled SQLite medication database.

Challenge page used during the solve.

1. The Challenge

The Aurora Patient Portal app contained a local medication database. After recovering the current patient information in the preceding app challenges, the goal was to identify the medication other than Ibuprofen.

2. Locate the Database

Unpack the IPA and inspect the app bundle. The file **aurora_meds.sqlite** is a standard SQLite database with a table named medications.

3. Query the Patient Row

The recovered patient ID is 847261. Querying that row returns two medications:

```
pid: 847261
medication_1: Ibuprofen 400 mg
medication_2: Candesartan 16 mg
```

4. Answer the Challenge

Because the prompt explicitly asks for the medication other than Ibuprofen, the required name is Candesartan.

5. The Flag

```
deadface{Candesartan}
```

6. General Method

• Unpack mobile application bundles and inventory embedded databases/resources.

• Inspect SQLite schema before querying.

• Use identifiers recovered from earlier artifacts to join the challenge chain together.

Summary

Field	Result
Category	Mobile App / SQL
Database	aurora_meds.sqlite
Patient ID	847261
Medication	Candesartan
Flag	deadface{Candesartan}
